

TOILET TRAINING

Did you know...

The Flubaroo Add-on in Google Sheets used to grade quizzes allows for multiple correct answers & answers within a range.

1. Want to allow for **more than one correct answer to a fill-in question**? Just put **%or** between correct answers when filling out your answer key, like this:

1. On Monday a few students brought their dogs to class. Give the name of one of the dogs.
(only provide the name of one dog)

sabre %or pat %or big al

If a student submits any of the answers, Flubaroo will mark it correct.

2. Great for STEM...allow students to enter a **correct answer that falls within a certain range**. The special **%to** operator tells Flubaroo to expect a numerical answer that falls between the numbers given.

Strictly, for a range of A %to B, an answer x will be correct if $A \leq x \leq B$ (note the equals signs).

But wait, there's more....

Because Flubaroo is expecting a numerical input for this question, Flubaroo will throw away any text that follows the number. Specifically, a student may not realize that you're looking for just the numerical part of the answer, and might also include the units like this: 78.53cm². Don't worry, before grading Flubaroo will throw away any text following the number, so this will be marked as correct too!
